Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Porphyromonas gingivalis dipeptidylpeptidase-7 (DPP-7).

Dipeptidylpeptidase-7; DPP-7; enzyme; amidolytic cleavage; DPP-7 inhibitor identification; periodontal disease; gingivitis; periodontitis.

Porphyromonas gingivalis.

WO200238742-A2

16-MAY-2002.

```
Porphyromonas gingivalis dipeptidyleptidase-7 (DPP-7) enzyme. The DPP-7 enzyme has amiddlytic activity for cleavage of a peptide bond between the second and third amino acids from the N-terminal end of a target peptide. The DPP-7 target peptide has an aliphatic or aromatic residue as a substituent on the alpha-carbon atom of the second amino acid from the N-terminal end. The DPP-1 protein and DNA sequences of the invention are useful for identifying a DPP-7 inhibitor. DPP-7 inhibitors are useful for reducing the growth of a bacterium and protecting an animal from a periodontal disease caused by Porphyromonas gingivals (e.g., gingivitis or periodontitis). The present amino acid sequence represents the porphyromonas gingivals (PDP-7) enzyme of the
                                                                                                                                                                                                           of

The invention comprises the amino acid and coding sequence of the Porphyromonas gingivalis dipeptidyleptidase-7 (DPP-7) enzyme. The DPP-7 enzyme has amidolytic activity for cleavage of a peptide band between the second and third amino acids from the N-terminal end of a target peptide. The DPP-7 target peptide has an aliphatic or aromatic residue as a substituent on the alpha-carbon atom of the second amino acid from the N-terminal end. The DPP-1 protein and DNA sequences of the invention are useful for identifying a DPP-7 inhibitor. DPP-7 inhibitors are useful for reducing the growth of a bacterium and protecting an animal from a periodontal disease caused by Porphyromonas gingivalis (e.g. gingivitis or periodontitis). The present amino acid sequence represents the

The present invention relates to toluene degrading enzyme genes and proteins tuth (see AAF23629 and AAB59831), tutI (AAF23630 and AAB59832), tutE (AAF23631 and AAB59834) and tutG (AAF23632 and AAB59834). The toluene degrading enzymes are homologues of pyruvate formate lyase. Toluene degrading enzymes are useful for biological treatment of organic compounds and in particular for the degradation of folluene and its analogs contained in liquid or solid waste source. The present sequence is a protein sequence for toluene degrading enzyme, TutD.
                                Composition comprising toluene degrading enzyme useful for biological treatment of organic compounds, especially for degrading toluene or its

The present invention relates to toluene degrading enzyme genes and proteins tuth (see AAF23629 and AAB59831), tut1 (AAF23630 and AAB59832), tutF (AAF23631 and AAB59834). The tute (AAF23631 and AAB59834). The toluene degrading enzymes are homologues of pyruvate formate lyase, toluene degrading enzymes are useful for biological treatment of organic compounds and in particular for the degradation of foluene and its analogs contained in liquid or solid waste source. The present sequence is a protein sequence encoded by toluene degrading enzyme gene, TutD/E.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 729 SerProArgSerThrThrGlyArgArgTrpSerSerProAlaArgArgSerAlaGlyArg 748

disease, ischemmiatory conductors such as alternites, without and cancer and for promoting wound healing. The sequences are used to induce the proliferation of neural cells and regeneration of nerve and brain tissue, and are useful for the treatment of central and peripheral brain tissue, and are useful for the treatment of central and peripheral contains system diseases and neuropathies, such as Alzheimer's disease, Parkinson's disease, and amyotrophic lateral cartivity, regulation of haematopoiesis, treatment of myeloid or lymphoid cell disorders and platelet disorders such as thrombocytopenia, regeneration of bone, cartilage, tendon, ligament and/or nerve tissue regeneration of bone, cartilage, tendon, ligament and/or nerve tissue corresponded to the sequences of the invention are also useful for gut disease. The sequences of the invention are also useful for gut correction or regeneration and treatment of lung or liver fibrosis, reperfusion injury in various tissues, immune deficiencies and disorders including severe combined immunodeficiency (SCID), bacterial or fungal infections, autorimmune disorders e.g. multiple sclerosis and myssthenia gravis, allergic conditions such as asthma, thrombolysis or thrombosis and coagulation disorders. Sequences ABG6666-ABG66758 represent human coagulation disorders. Sequences ABG6666-ABG66758 represent human coagulation and coagulation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to human novel polynucleotides and associated polypeptides. The polynucleotides and polypeptides are useful for treating inflammatory conditions such as arthritis, nephritis, Crohn's
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            506 CAGACGAGAACCAACTCTGCATCGTAGAGCCTTTCTATTCCAACAACGAATACTTCCTCA 565

polypeptides. The polynucleotides and polypeptides are useful for treating inflammatory conditions such as arthritis, nephritis, Crohn's disease, ischaemia-reperfusion injury, shock, sepsis, immune responses and cancer and for promoting wound healing. The sequences are used to induce the proliferation of neural cells and regeneration of nerve and brain tissue, and are useful for the treatment of central and peripheral nervous system diseases and neuropathies, such as Alzheimer's disease, Parkinson's disease, Huntington's disease and amyotrophic lateral sclerosis. The sequences are involved in chemotactic or chemokinetic activity, regulation of haematopoiesis, treatment of mysloid or lymphoid cell disorders and platelet disorders such as thrombocytopenia, regeneration of bone, cartilage, tendon, ligament and/or nerve tissue growth, tissue repair, healing of burns, incisions, ulcers, treatment of cisease. The sequences of the invention are also useful for gut protection or regeneration and treatment of lung or liver fibrosis, reperfusion injury in various tissues, immune deficiencies and disorders including severe combined immunodeficiency (SCID), bacterial or fungal infections, autoimmune disorders e.g. multiple sclerosis and myasthenia gravis, allergic conditions such as asthma, thrombolysis or thrombosis and coaqulation disorders. Sequences ABG66666-ABG66758 represent human novel polypeptides of the invention. invention relates to human novel polynucleotides and associated

The UNC-53 proteins and nucleic acids are useful as medicaments to promote neuronal regeneration, revascularisation or wound healing, or for treatment of chronic neurodegenerative diseases (e.g. Alzhenier's or Huntingdon's disease) or acute transactic injuries. Transgenic cells and organisms transfected with UNC-53 cDNA can be used to determine whether a substance is an inhibitor or enhancer of the regulation of cell shape or motility or the direction of cell migration by screening for a phenotypic change in the cell. Inhibitors can be used to alleviate the spread of disease inducing cells or metastasis. Probes derived from the chances can be used to alleviate the spread of disease inducing cells or metastasis. Probes derived from the change of the UNC-53 protein can be used to identify proteins which are active in the signal transduction pathway that can be used as

UNC-53 protein variants 8A and 7A of Caenorhabditis elegans are new. The UNC-53 proteins and nucleic acids are useful as medicaments to promote neuronal regeneration, revascularisation or wound healing, or for treatment of chronic neurodegenerative diseases (e.g. Alzheimer's or Huntingdon's disease) or acute traumatic injuries. Transgenic cells and organisms transfected with UNC-53 sobA can be used to determine whether a substance is an inhibitor or enhancer of the regulation of cell shape or motility or the direction of cell migration by screening for a phenotypic change in the cell. Inhibitors can be used to alleviate the spread of disease inducing cells or metastasis. Probes derived from the CDNA sequences can be used to identify homologues of the C. elegans are active in the signal transduction pathway that can be used as mentioned above.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ...-TITACCAACCACTGC 270
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Caenorhabditis elegans UNC-53 protein 8A and 7A variants - useful to promote neuronal regeneration, revascularisation or wound healing.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              UNC-53; neuronal regeneration; revascularisation; wound healing; neurodegenerative disease; Alzheimer's disease; Huntingdon's; peripheral neuropathies; metastasis inhibition; cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Length:

The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or

quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disorders involving aberrant protein expression or biological activity. The polypeptide and polynucleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and amino acid sequences. ABG00010-ABG30377 represent novel human diagnostic amino acid sequence of the invention.

Note: The sequence data for this patent did not appear in the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences. 1890 SerLeuThrAsnTyrAlaThrSerLeuAsnThrProValSerTyrProProTrpThrPro 1909 1930 GluIleSerThrProLysThrSerPro---ProProThrSerGlnMetValGluPhe--- 1947 ---ProValLeuGlyThrArgMetThrSerSerAsnThrGlnProLeuLeuMetThrSer 1966 1967 TrpAsnileProThrAlaGluGlySerGlnPheProIleSerThrThrIleAsnValPro 1986 956 GTATCAAATATGCCAGCAAGTATGCTCAGAGTGCTAACTATTGGAAGAATTCGATCGGTA 1015 1016 TGAACCGCGGTCTCGCTCGTCTTGACGTGATAGGTCGTAAGCGTGCCGAGGAAAGAGCAT 1075 TCGCAGACTGGATCCGTAAGAACGGCAAGAGTGCTGTCTATGGCGATGTATTGTCTTCTC 1135 TCGAAAAGGCTTATAAGGAAGGAGCCAAGGCCAACCGTGAGATGACTTATTTGAGCGAGA 1195 491 CCAAAAAAGAAAATGCAGACGAGAACCAACTCTGCATCGTAGAGCCTTTCTATTCCAACA 550 1987 ThrserAsnGluMetGluThrGluThrLeuHisLeuValProGlyProLeu---SerThr 611 CCAGCTCTGTAGGTAAGTTCGGAGGCGATACGGACAACTGGATGTGGCCGCGTCACACGG ---GCAAGGACAATAAACCCTATAAGCCCGTTTAACTTCGCTGCCGTATCCATGCAAGGCT ---LeuVal 1910 SerSerAlaThrLeuProSerLeuThrSerPheValTyrSerProHisSerThrGluAla 785 ACAAGGCTGACG-----ACTATGCCATGACCATCGGTTTCCCGGCAGTACGGATCGCT ACCTCACTTCTTGGGGTGTGGAAGATCGTATCGAAAACGAGAACAATCCTCGTATCGAAG 899 TTCGCGGTATCAAGCAAGGCATCTGGAAGGAAGCCATGAGGG----CAGATCAGGCTACCC 551 ACGAATACTTCCTCATCGTCTACGATGTATTCAAGGACGTTCGTATGGTATTTGCTCCTC 2570 133 81 195 191 29 Length: Matches: Conservative: 1877 SerAsnThrArgLysMetThrSerLeuLeuGluLysThr----Mismatches: Indels: 1864 ProThrLysAsnValLysThrThrThrAsnCysPheSer (1-2570)US-10-008-355-1 (1-2139) x ABG06375 0.000223 148.00 35.67% 22.17% 3.87% SerGlnThrGly-----2570 AA; 2006 PheThrAla ----Best Local Similarity: Percent Similarity: Alignment Scores: Sequence Query Match: DB: 839 2009 2015 671 728 1948 1076 1136 1889 g qq Ω g Qy a ò 000000000000000x8 ò pp g qq qq δ Q ò QQ ο̈́ 9 δ ò ŏ δy òγ

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             q
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ŏ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to a protein (ABP25413-ABP30895) from group B streptococcus/GBS (Streptococcus agalactiae) or group A streptococcus/GBS (Streptococcus agalactiae) or group A streptococcus/GBS (Streptococcus pyogenes), comprising one of 5481 sequences (S1), given in the specification. The proteins have entihacterial and antiinflammatory activity. (I), nucleic acids encoding (I), ABN66044-ABN71526 and antibodies that bind (I) are used in the manufacture of medicaments for the treatment or prevention of infection or disease caused by Streptococcus bacteria, particularly S. agalactiae and S. pyrogenes. Nucleic acids encoding (I) are used to detect Streptococcus in a Streptococcus ample. (I) is used to detect of a compound binds to (I). A composition comprising (I) or a nucleic acid encoding (I), may be used to detect streptococcus that is prevented or treated may be meningitis. Nucleic acid encoding (I) may be used to recombinantly produce (I) and may be used in gene therapy. Antibodies to (I) are used for affinity characterinty.
                                                                                                                                                                                                                     Streptococcus; GAS; GBS; group B streptococcus; Streptococcus agalactiae; group A streptococcus; Streptococcus pyogenes; antibacterial; antlinflammatory; infection; vaccine; meningitis; gene therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New Streptococcus protein for the treatment or prevention of infection or disease caused by Streptococcus bacteria, such as meningitis, and for detecting a compound that binds to the protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Fraser C;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           1368

The invention i useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL01840-ABL16175) and the encoded proteins (ABB57737-ABB72072). The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signalling and cell-cell interactions
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ||||

                                                                                                                                                                                                                                                                                                                                                                                                                                                           In AAX87940. This DNA fragment comprises a Stul-Stul fragment of M. tuberculosis genomic DNA and contains an insertion sequence-like element and repetitive sequences. The DNA fragment is useful as a probe, especially for detecting or identifying M. tuberculosis in clinical isolates and body fluids e.g. sputum, cerebrospinal fluid, pleural fluid, urine, gastric lavage, bronchial lavage, pericardial or Lymph node aspirate (all claimed). It is also useful for restriction fragment length polymorphism analysis of M. tuberculosis of tuberculosis and M. tuberculosis infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       74 TrpCysHisProGlyTyrSerCysArgTyrTrpCys-------HisProArg*** 89

```
The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention is useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticidas, therapeutics and pharmaceutical furge. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL01840-ABL16175) and the encoded proteins
                                                                                                                                                                                                                                                                                                        (ABB57737-ABB72072).
The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                           New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signalling and cell-cell interactions
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               2067 GATGTCCACGCTGATTGTGCGCTGCAGATCGGGTTCGAACTCGATGTCACCACTCATAGC 2008
